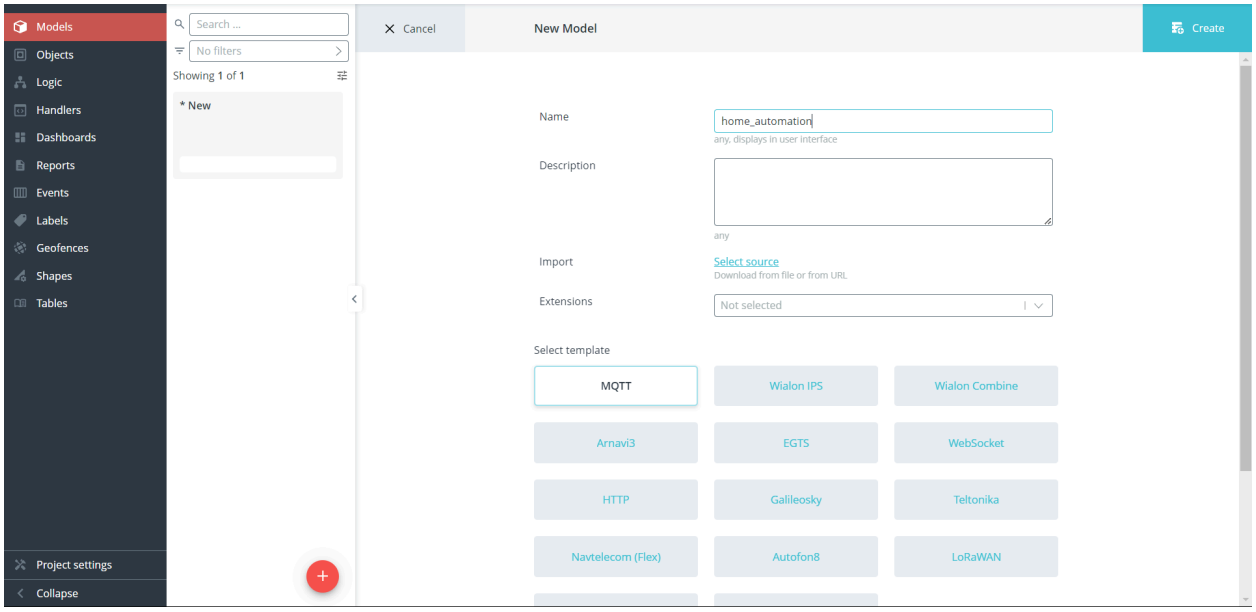
Rightech Cloud

STEP 1:

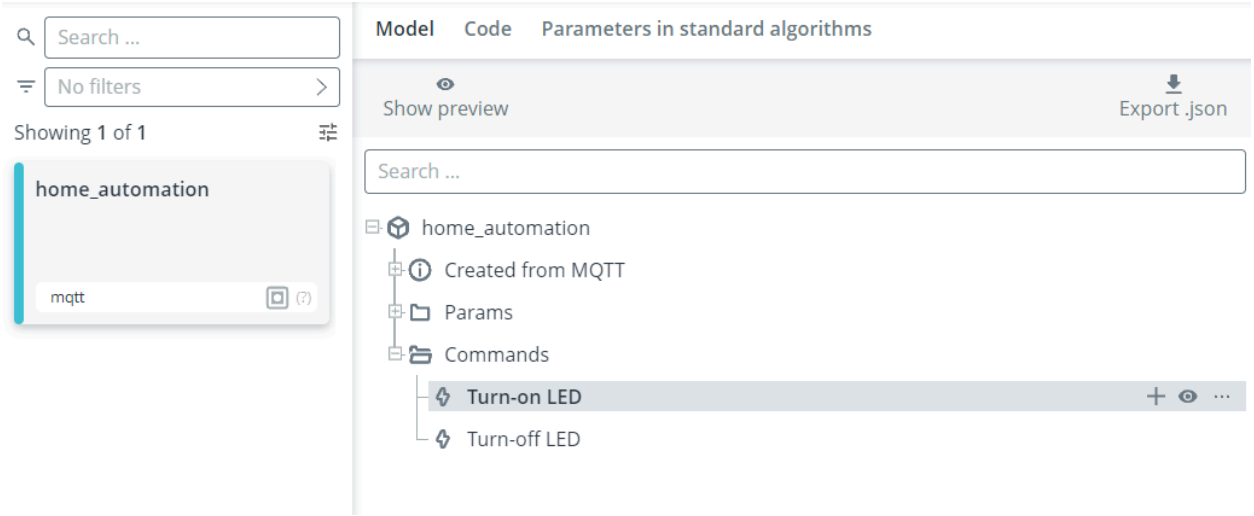
Open rightech cloud and create an account

STEP 2:

Go to models and create a new model



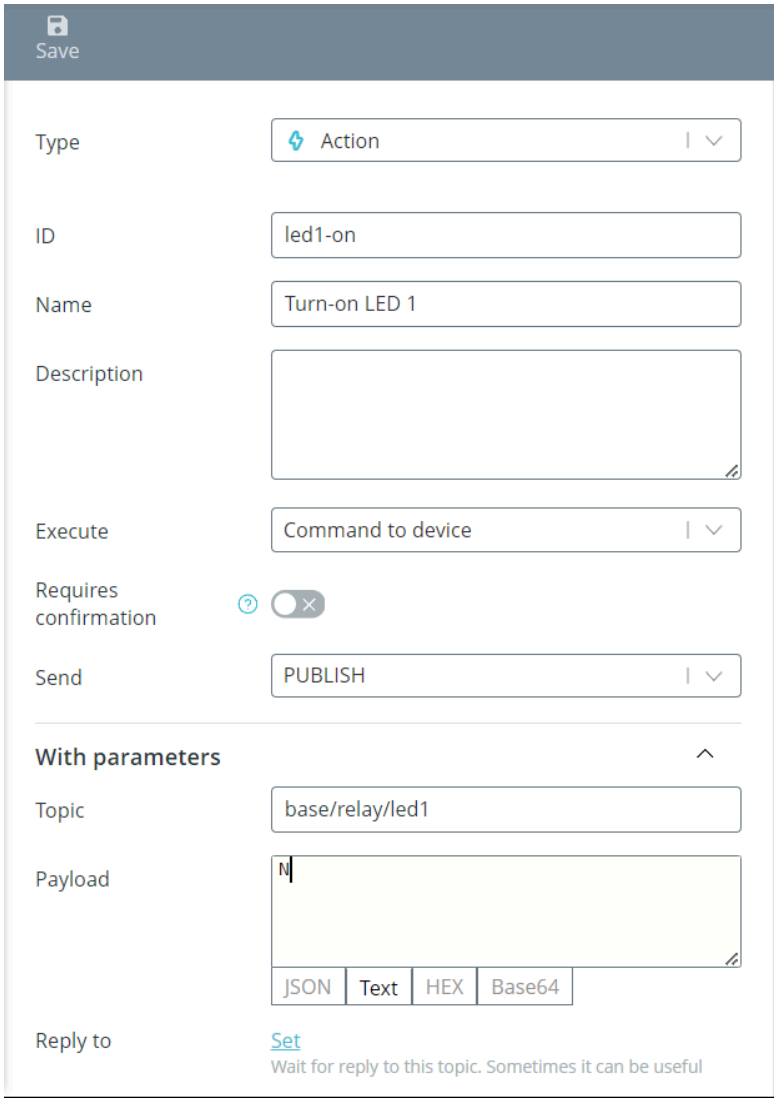
Give a model name and select MQTT. Click on create.



STEP 3:

Now we have to set up led configuration for the project.

To turn ON led 1:

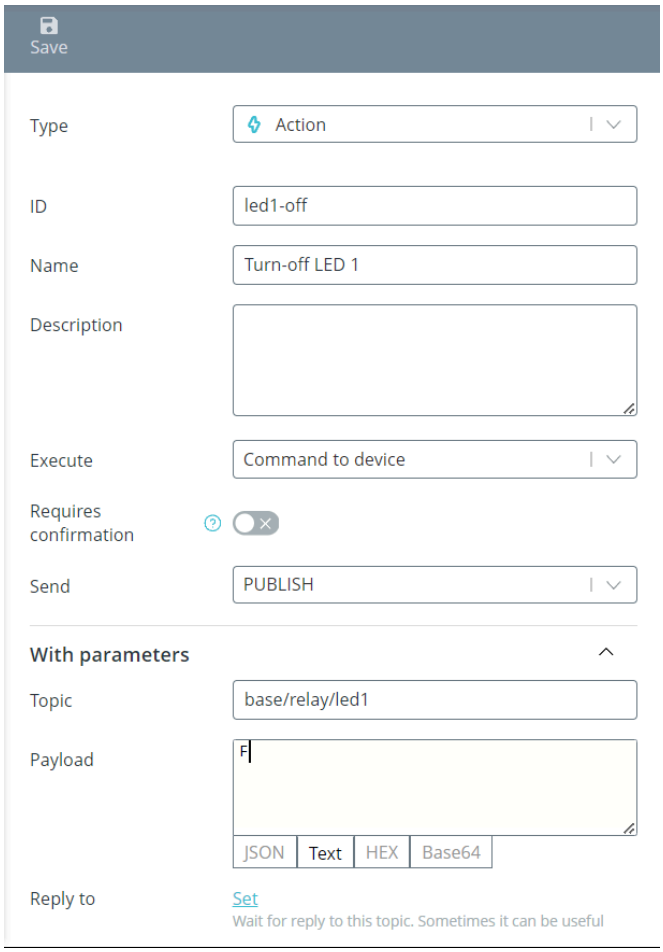


Change the ID to “led1-on”

Change the name to “Turn-on LED 1”

Go to payload and select text, then write “N”.

To turn OFF led 1



Change the ID to “led1-off”

Change the name to “Turn-off LED 1”

Go to payload and select text, then write “F”.

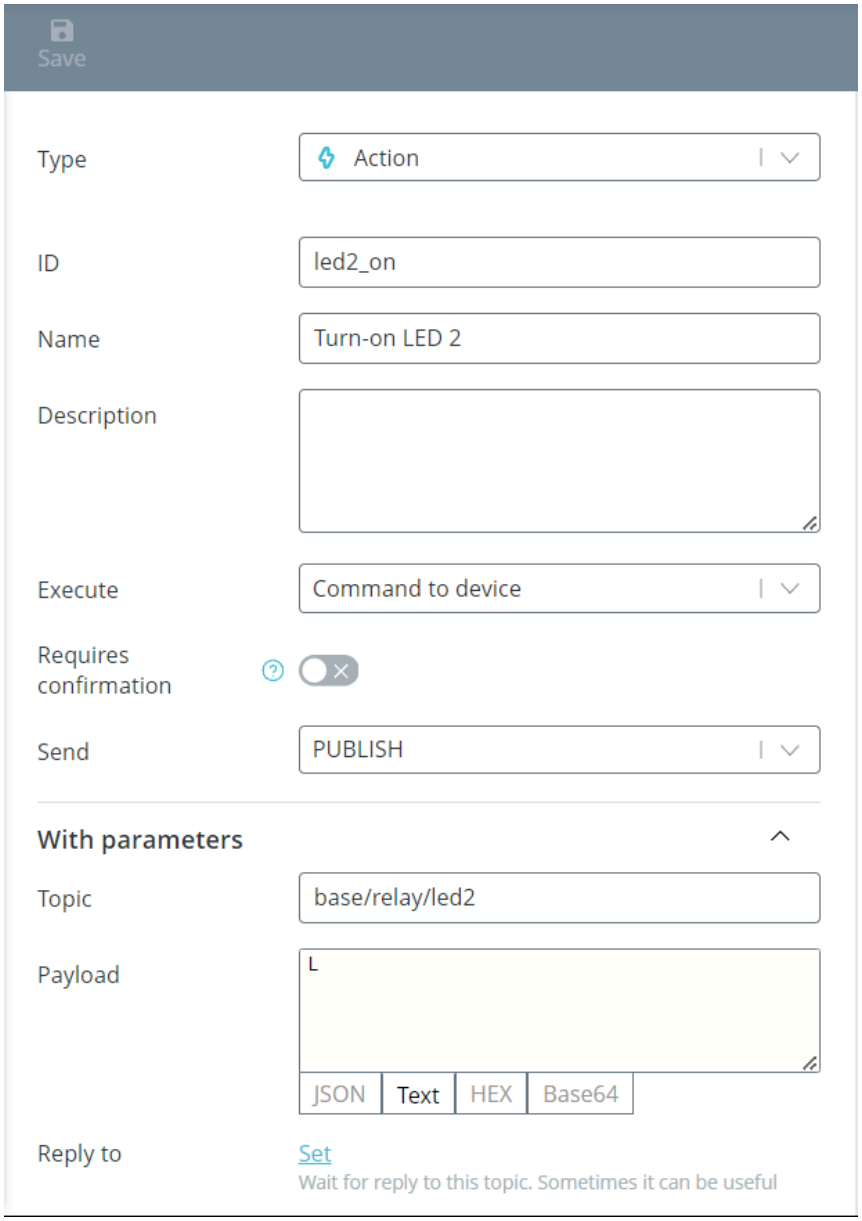
To turn ON led 2:

First click on the more options icon and it’ll show make copy and delete options.

Click on the “Make copy” option. This will create a copy of the led 1.

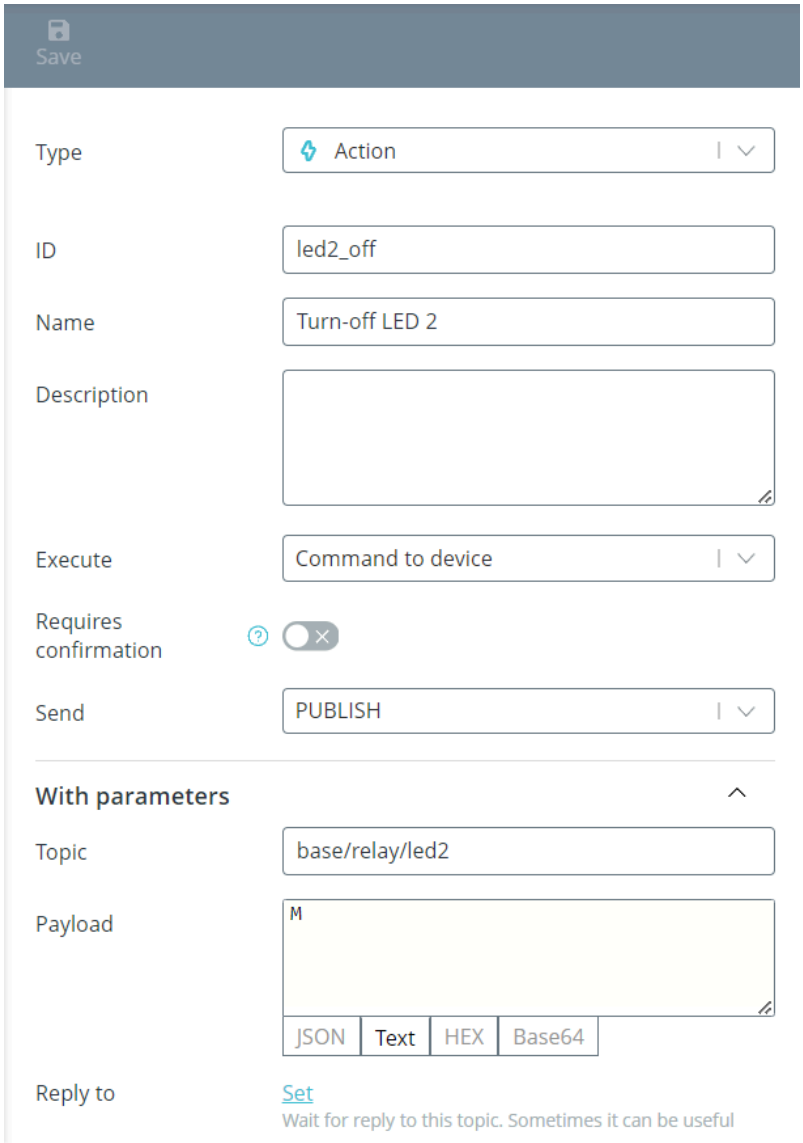
In this we can just change the led 1 to led 2 to make it work.

Turn ON led 2:



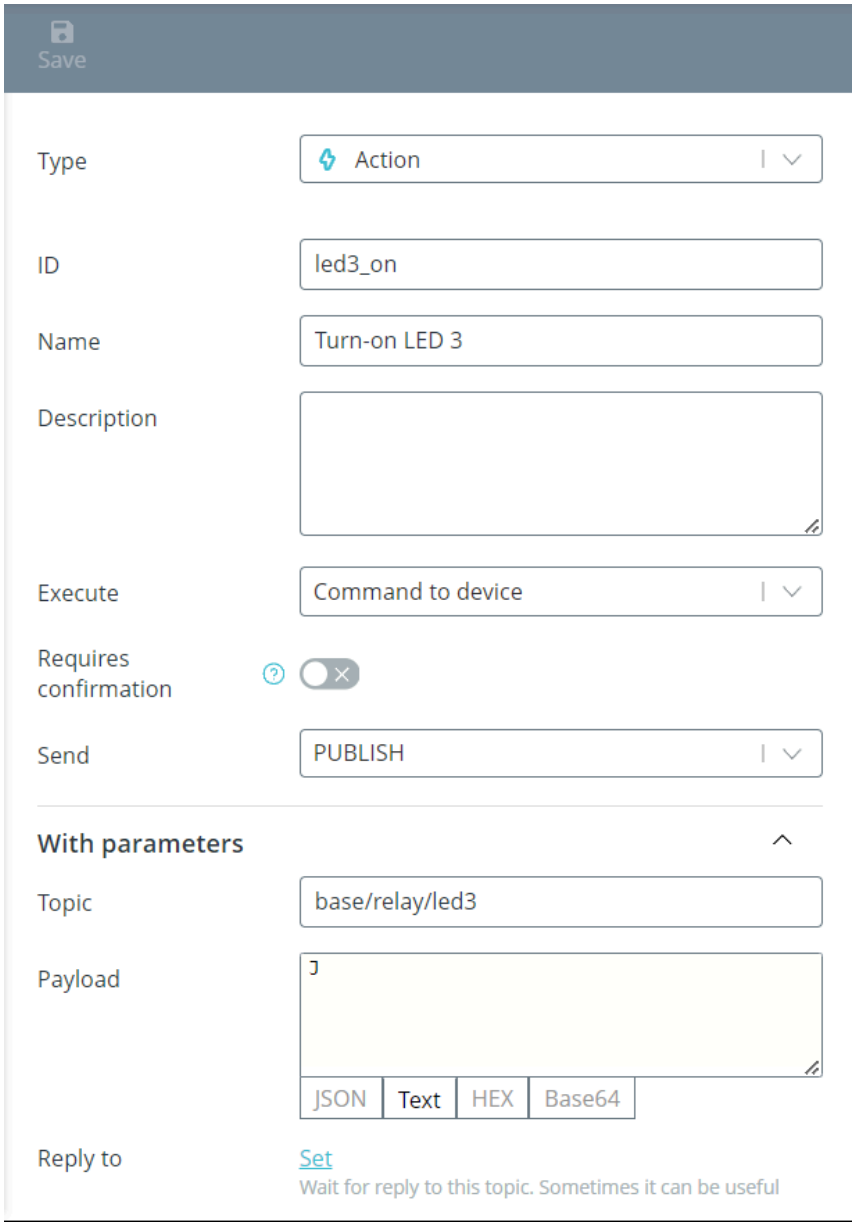
In topic change it to “base/relay/led2”

Turn OFF led 2:



In topic change it to “base/relay/led2”

Turn ON led 3:



Turn OFF led 3:

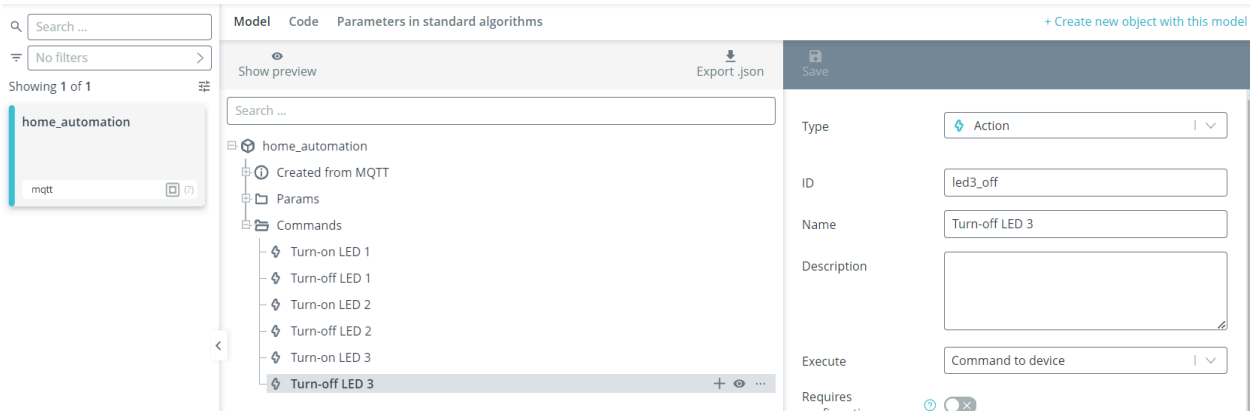
STEP 4:

Now,



Click on Create new object with this model option on top right.

Then click on save and then open the edit tab.

This device has not sent any data yet.

Check our repo with MQTT examples for various IoT platforms:

- Arduino | NodeMCU
- Node.js | Raspberry Pi
- FreeRTOS | ESP32

```
#define MQTT_SERVER_HOST  "dev.rightech.io"
#define MQTT_CLIENT_ID    "mqtt-satyambarun_nayak-nnpj62"
```

You can also publish some test payloads with any MQTT client.

For example with `mosquitto_pub` client from Eclipse Mosquitto project:

```
$ mosquitto_pub -d \
    -h dev.rightech.io \
    -i mqtt-satyambarun_nayak-nnpj62 \
    -t base/state/temperature \
    -m 36.6
```

Or any other MQTT client tool like:

- MQTT X
- MQTT Explorer

If you have any further questions contact our tech guys
or contact us at Telegram.
